02 SOAR Playbook Summary

1. Playbook Summary: Automated Phishing Incident Response

To significantly reduce the Mean Time to Respond (MTTR) for the Security Operations Center, a Security Orchestration, Automation, and Response (SOAR) playbook was developed to handle high-fidelity phishing alerts. Upon Wazuh detecting a malicious file download or suspicious email, the playbook automatically parses the indicator and queries VirusTotal for file hash reputation. If the hash is flagged as malicious, the SOAR platform triggers CrowdSec to execute a firewall-level IP block and simultaneously auto-generates a Tier 2 investigation ticket in TheHive for final analyst review.

2.Playbook Execution Validation Log

The following table documents the successful execution of the automated playbook during a simulated phishing alert:

Playbook Step	Status	Notes
Ingest Alert (Wazuh)	Success	Simulated phishing alert parsed correctly.
Check IP/Hash (VirusTotal)	Success	Indicator successfully flagged as malicious.
Block IP (CrowdSec)	Success	CrowdSec successfully blocked attacker IP (192.168.1.102).
Create Case (TheHive)	Success	Ticket successfully generated for SOC review.
