01_Alert_Management_and_Triage

1. Alert Classification Dashboard

The following dashboard was utilized to triage incoming SIEM alerts, prioritizing them based on severity (CVSS score) and mapping the identified attacker behavior to the MITRE ATT&CK framework.

	A	B	C	D	E	F
1	Alert ID	Alert Description	Priority	MITRE Tactic	CVSS Score	Status
2	1	Phishing Email:	High	T1566	7.5	Investigating
3	2	Log4Shell Explo	Critical	T1190	9.8	Escalated
4	3	External Port Sc	Low	T1046	0	Closed
5	4	Brute-force SSH	Medium	T1110	5.3	Open
6	5	VSFTPD Backdo	Critical	T1190	9.8	Escalated
7						

Fig.1: Alert triage dashboard categorizing incident priority, CVSS scoring, and MITRE ATT&CK framework mapping.

2. Threat Intelligence Validation

During routine alert triage, a suspicious file hash was identified and escalated for Open Source Intelligence (OSINT) validation using VirusTotal.

Threat Intel Summary: Analyzed a suspicious file hash (24d004a104d4d54034dbcffc2a4b19a11f39008a575aa614ea04703480b1022c) using VirusTotal. The file was flagged as highly malicious by 69 out of 71 security vendors and positively identified as the WannaCry ransomware trojan.

Recommendation: Immediately blacklist this exact SHA256 hash in the company EDR solution and execute a global sweep across all network endpoints to ensure the file does not currently exist in the environment.

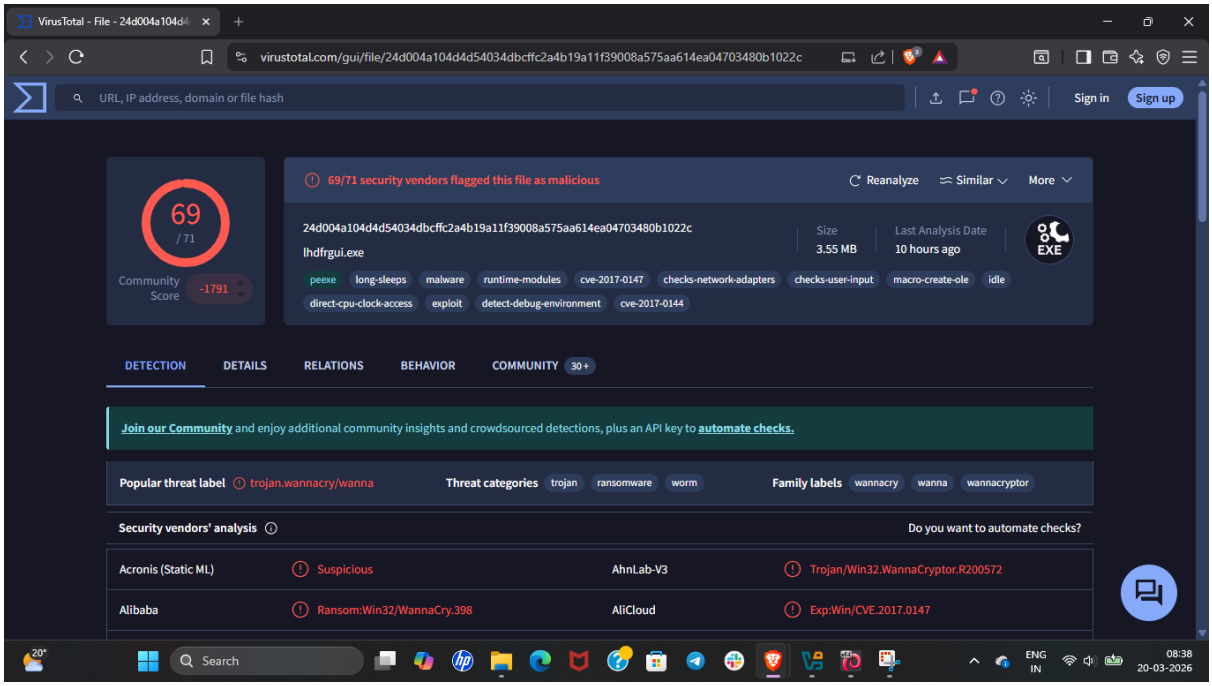

Fig.2: Open Source Intelligence (OSINT) validation using VirusTotal, confirming the malicious nature of the extracted file hash

3. Mock Incident Ticket (TheHive Format)

The following ticket was generated to track the critical VSFTPD vulnerability exploited on the internal network.

Title: [Critical] VSFTPD Backdoor Exploit Detected on Server

Description: Endpoint detection triggered on the internal FTP server. Unauthorized root access achieved via legacy VSFTPD v2.3.4 vulnerability. Immediate isolation required to prevent lateral movement. **Indicators of Compromise (IOCs):**

- **Attacker IP:** 10.0.2.15
- **Target IP:** 10.0.2.3
- **Vulnerability:** CVE-2011-2523
  Priority: Critical
  Assignee: SOC Analyst (Tier 1)
  Status: Escalated

4. Alert Escalation Communication

The following formal escalation was sent to the Tier 2 Incident Response team regarding the VSFTPD breach.

Subject: URGENT: CRITICAL ESCALATION - Active VSFTPD Exploitation Detected

To: SOC Tier 2 Team
From: SOC Tier 1 Analyst
Team,
I am escalating a Critical alert regarding an active VSFTPD v2.3.4 backdoor exploitation on our internal file server (10.0.2.3).
At approximately 08:20 AM, the SIEM triggered an alert for unauthorized root-level access originating from internal IP 10.0.2.15. I have temporarily isolated the affected server from the network switch to contain the threat, but I am seeing signs of a successful reverse shell connection prior to isolation.
Requesting immediate Tier 2 assistance for deep forensic memory analysis and to initiate the formal Incident Response playbook for critical server containment.
Please advise on your immediate availability.
